SENTINEL AI

From security signal to confident response.

A modular SOC platform connecting detection, explainable risk, attack prediction, response, and reporting.

FASTAPI • REACT • POSTGRESQL • AI/ML • SOAR

Security tools produce alerts. Sentinel AI produces a decision.

The idea is to preserve context from the first signal through investigation and controlled response.

PROBLEM 01

Fragmented context

Identity, IP, intelligence, detections, incidents, and reports are separated across tools.

PROBLEM 02

Alert overload

Raw events create noise when risk, evidence, and recommended action are not connected.

PROBLEM 03

Slow response

Analysts reconstruct the story manually before they can contain, escalate, or explain it.

THE IDEA

One explainable security loop: detect → understand → predict → respond.

A working end-to-end threat story

Sentinel AI already converts authentication behavior into persisted SOC evidence and action.

>5

FAILED ATTEMPTS

5 min

DETECTION WINDOW

90/100

HIGH RISK

200 OK

VERIFIED REPORT API

IMPLEMENTED + VERIFIED

Same user + same IP + sixth failure inside five minutes → HIGH alert

Traceable across security logs, AI risk, threat event, attack path, incident, notification, and report.

A broad need with a focused entry point

Sentinel AI starts with explainable identity threats and expands through modular security telemetry.

TARGET USER

SMALL & MID-SIZE TEAMS

Need unified visibility without assembling a large SOC stack.

TARGET USER

MANAGED SECURITY PROVIDERS

Need repeatable monitoring, evidence, reporting, and tenant-ready workflows.

TARGET USER

EDUCATION & PUBLIC SECTOR

Need accessible defensive tooling, auditability, and constrained automation.

WHY NOW

More telemetry + limited analyst capacity + rising identity attacks = demand for explainable automation.

No invented TAM figure: initial validation focuses on interviews, pilots, conversion, and measurable analyst time saved.

More than a dashboard. More accountable than a black box.

The advantage is the closed loop and the evidence that remains visible throughout it.

01 / CLOSED LOOP

End-to-end

A single event connects authentication, logs, intelligence, risk, prediction, incidents, notifications, and reports.

02 / MODULAR

Phase-owned

Nine independent capabilities evolve separately while a central API preserves one operational experience.

03 / EXPLAINABLE

Evidence first

Rules and AI scores retain username, IP, time window, frequency, reason, confidence, and response state.

Land with one visible threat story. Expand with telemetry.

A product-led technical pilot turns the working authentication use case into broader security adoption.

0
1

PILOT

Deploy the central SOC and prove login-to-report visibility with a real security team.

0
2

INTEGRATE

Add approved identity, WordPress, WAF, SIEM, and threat-intelligence event sources.

0
3

EXPAND

Enable web, network, endpoint, collaboration, compliance, and multi-tenant modules.

PILOT METRICS

Time-to-triage • detection-to-report completion • analyst adoption • false-positive review

Turn a verified core into a broader defense platform

The next milestones expand coverage while preserving accuracy, safety, and the existing architecture.

NOW

HARDEN

RBAC
real-time streaming
automated tests
production observability

NEXT

WEB DETECTION

WordPress telemetry
SQL injection
XSS + traversal
API abuse

THEN

ENTERPRISE

IDS + EDR inputs
multi-tenancy
high availability
compliance packs

The ask: pilot partners, security feedback, and integration opportunities.

Sentinel AI — detect • understand • predict • respond
